AGENDA

1 Why AI security is critical in today's data-driven world

2 A quick intro to Google's Secure AI Framework (SAIF)

3 Applying SAIF Across Dimensions

4 Eliminating Unknown Risks

5 Operationalizing AI Security

6 Takeaways & Call to Action

What is Security ?

Google Developer Groups

Why AI security is critical in today's data-driven world ?

- **AI adoption** is exploding and **cloud risks** fly under the radar because organizations don't know they have sensitive data lurking in their environment.
- This creates a treasure trove for attackers.
- Hidden PII, credentials, or keys often find their way into training datasets, **creating high-value attack targets**.

Compromised Identity is the root cause

50% of the ransomware intrusions responded to, were a result of compromised identity

Google Developer Groups

**There is no
security
without
secure
identity.**

Multi-factor Authentication Bypass

Register devices
Establish persistence

Sim swapping
Actors gaining control
of your number

Push notifications
Easy to abuse

Adversary in the
middle
On the rise

Session token
theft
Increasingly popular
via infostealers

Google: a **Leader** in securing enterprise data

Google differentiates with data threat and risk visibility, access controls, masking, encryption, and addressing supplier risk. It is superior for privacy (including confidential computing), information governance, and AI security and governance use cases.

AI and Security

AI and security can largely be organized into three buckets:

01

Securing the
use of AI

02

Using AI to secure
other systems

03

Countering the
attacker armed with AI

Google Developer Groups

What is SAIF?

Secure AI Framework Approach

Google Developer Groups

What is SAIF?

- **SAIF** (Secure AI Framework) is a **security framework published by Google** that provides a structured approach to building, deploying, and maintaining **safe, secure, and trustworthy AI systems**.
- It is designed to help organizations **reduce risks associated with AI**.

Why SAIF Matters?

- As **AI adoption rapidly accelerates** -> **poor security practices scale**
- Creating vulnerabilities fast.
- SAIF reduces this risk by enforcing security-by-design.
- SAIF prevents threats like data leakage, poisoning, jailbreaks

SAIF 6 pillars

01

Expand strong security foundations to the AI ecosystem

02

Extend detection and response to bring AI into an organization's threat universe

03

Automate defenses to keep pace with existing and new threats

04

Harmonize platform level controls to ensure consistent security across the organization

05

Adapt controls to adjust mitigations and create faster feedback loops for AI deployment

06

Contextualize AI system risks in surrounding business processes

Overlay SAIF principles on Model Lifecycle

Discovery and problem definition	● Identify security and compliance requirements early. ● Evaluate data sensitivity and ethical risks before choosing an AI approach.
Data Collection and Preparation	● Collect the data that you will need to train your AI model. ● Assess datasets for vulnerabilities (bias, poisoning risk) ● Analyze & label the data (masking)
Model design and development	● Design and develop the AI model that will address the business opportunity that you have defined. ● Design mechanisms to prevent prompt injection, data leakage. ● Define authenticated access and authorization pathways. ● Audit model performance. ● Red-team models during development to find vulnerabilities.

Overlay SAIF principles on Model Lifecycle

Model training, fine-tuning, and testing	• Secure training infrastructure (identity, environment isolation). • Data governance to make sure training data is not tampered. • Monitor training workflows for anomalies. • Ensure testing includes misuse and edge-case scenarios.
Model deployment and integration with end-product	• Apply runtime defenses (rate limiting, monitoring, filtering). • Ensure minimal access to sensitive data. • Establish policies for version control and rollback.
Model behavior monitoring and adjustment	• Continuously log usage and flag abnormal behavior. • Monitor for drift, bias, jailbreaks, or new attack vectors. • Reassess risks regularly and re-train(feedback loops). • Validate performance + safety metrics over time.

Shift Left

Google Developer Groups

Shift Left

In the context of AI development, shifting left ensures:

- Data used for training is verified and safe
- Models are designed to resist attacks
(e.g., prompt injection, poisoning)
- Access and deployment controls are planned early

Relevant Questions in the Model Lifecycle

Discovery and problem definition	• What type of data will the model need? • Do you have permission to use the data for this purpose? • What will the model do? That is, what is the use case? • Will it be internal or external facing? • Where will the model be hosted? On prem, CSP, or SAAS offering?
Data Collection and Preparation	• How will the organization ensure the quality and integrity of the data collected? • How will the data be anonymized or de-identified to protect privacy? • What measures will be implemented to protect the data from tampering?
Model design and development	• What kind of access control is used to restrict access to training environment? • How will the organization ensure that the model is used in a safe and responsible manner? • How will you deal with vulnerabilities in your chosen ML framework?

Relevant Questions in the Model Lifecycle

Model training, fine-tuning, and testing	• What stress tests will be used to evaluate the model's robustness? • How will the model's operation be monitored and evaluated? • What processes will be in place to track and document changes made to the model during fine-tuning?
Model deployment and integration with end-product	• How will the organization ensure the AI model is deployed securely into the production environment? • How will the integration of the AI model with the end product be secured, especially regarding data flow and API security?
Model behavior/outcome monitoring and adjustment	• What monitoring and logging mechanisms will be implemented to track the model's performance? • What processes will be in place to manage and respond to security incidents discovered after deployment?

First, remove the unknowns with continuous data discovery.

Go enable Sensitive Data Protection across your org

Second, now that you have insights, make sure data is in the right place.

Option 1: Mask out data that you don't need, but keep the context

Input

Hey Bill, I have a question about my Bill from January

Output

Hey [PERSON_NAME], I have a question about my Bill from January

Input

[Customer] Oh my card, it is 4111-1111-1111-1111 is that what you need?

Output

[Customer] Oh my card, it is [CREDIT_CARD_NUMBER] is that what you need?

Option 2

Completely remove or block unwanted data types

Secrets like

- AUTH_TOKEN
- AWS_CREDS
- GCP_CREDS
- ENCRYPTION_KEY

Sensitive Documents like

- Source Code
- Resume
- Financial Context
- Medical Context
- Political / Religious,etc

Google Developer Groups

Automate Filtering with De-Identification

The diagram illustrates the process of automating filtering with de-identification. It begins with a file explorer interface showing a directory structure with files like 'file_01.csv', 'file_02.csv', etc. A large black arrow points from this interface to a stack of documents representing redacted data. The documents show 'Redacted Image' and 'Contact Details on File' with various fields redacted. A final document titled 'Tokenized and Redacted Data' shows a table with columns 'ID', 'Job Title', 'Phone', and 'Comments', where sensitive information has been replaced with tokens or redacted.

ID	Job Title	Phone	Comments
359740	Senior Engineer	807-468-0678	Please email them at Jane@imadethisup.com
981587	VP Engineer	713-910-6707	none
394091	Lowyer	692-390-4146	Updated phone to: 692-398-4146
980941	Senior Ops Manager	294-467-5508	none
490456	Junior Ops Manager	791-954-3281	Tried to verify account with their SSN 222-44-5555

Google Developer Groups

3. Make sure data has right Access Control : make use of tag based conditional access

Highly Sensitive

The screenshot shows the Google Cloud BigQuery Explorer interface. The left sidebar displays a project named 'dippshqrun1-admin1' with a folder 'healthcare_exchange' containing tables 'clinical1_export', 'clinical2_export', 'profile_findings', and 'research_data'. The main panel shows the 'clinical1_export' table selected, with tabs for SCHEMA, DETAILS, PREVIEW, TABLE EXPLORER, INSIGHTS, LINEAGE, DATA PROFILE, and DATA QUALITY. The PREVIEW tab is active, but it displays an 'Access Denied' error message: 'Access Denied: Permission bigquery.tables.getData denied on table dippshqrun1-admin1:healthcare_exchange/clinical1_export (or it may not exist)'.

Not Sensitive

The screenshot shows the Google Cloud BigQuery Explorer interface for the 'clinical2_export' table. The left sidebar shows the same project and folder structure. The main panel shows the 'clinical2_export' table selected, with the PREVIEW tab active. The table preview displays the following data:

Row	id	visit_type	stat1	stat2	stat3
1	15	repeat	2049	4460	9115
2	16	repeat	9094	8187	8898
3	22	repeat	2359	461	8880
4	27	repeat	4876	9088	7874
5	46	repeat	6885	1570	8884

DEMO TIME!

**...WHAT COULD POSSIBLY GO
WRONG**

Demo Overview

We will use:

- **Google Console + CLI**
- **Sensitive Data Protection (Discovery/Profiling)**
- **Cloud Storage (GCS)**
- **BigQuery**
- **Vertex AI**

The live demo will illustrate

1. how sensitive records stored in **GCS and BigQuery** are automatically identified and tagged based on risk level.
2. We will enforce **tag-based IAM** to prevent Vertex AI from training on high-sensitivity data
3. We will see how automated **redaction workflows** can generate sanitized copies for safe model training.
4. We will also explore how Looker Studio provides an auto-generated security report summarizing sensitive asset exposure.

Understand the Data risk

Check with the AI Red Team

Fourth, access data posture and risk

Check for public exposure

Public sensitive data

Next steps

1. To remediate public exposure, remove any IAM binding that grants all users or all authenticated users access to the related resource. To identify the related resource, click the Sensitive Data Protection data profile in this finding.
2. Investigate the sensitive elements by running a Sensitive Data Protection deep inspection scan on the resource to identify all offending objects, and then remove or de-identify them.

Google Developer Groups

We'll explore how to:

- **Discover and classify hidden sensitive data** (“unknown unknowns”) in AI environments.
- **Automate masking, filtering, and de-identification** of training data.
- **Enforce tag-based conditional access** to ensure least-privilege principles.
- **Continuously assess data posture and public exposure** using automated insights.
- Showcase a **visual workflow** illustrating how SAIF enables automated protection and compliance.

Google Developer Groups

Key Takeaways:

- Understand how **SAIF** strengthens security throughout the AI lifecycle.
- Learn **data-centric protection strategies** for safe AI development.
- Gain actionable methods to **discover, de-identify, and secure sensitive data**.
- Build **secure-by-design AI pipelines** using Google Cloud capabilities.
- Walk away with a **practical checklist** to operationalize AI security.
